

Conclusion /

What is good

- **Full stack type safety**, this is super powerful 🚀
- Great **developer experience** with autocomplete, validation and code generation right in IDE
- The **speed of implementation** for new features has drastically increased, without sacrifice in quality.
- Auto generated always up-to-date **documentation** and playground, that does not take any time to maintain

Conclusion /

What is good

- On the client, **Apollo** solves a lot of problems out of the box, like pagination, subscriptions, optimistic updates, garbage collection etc. No need to write a lot of boilerplate code
- Better **performance** for clients that need to fetch complex connected data
- Straightforward deprecations and **measuring usage** of certain fields, API evolution without versioning
- It allows to implement clear **domain ownership** between multiple teams while still maintaining a general schema. It unifies them and hides their complexity.
