

What is good

conclusion

- On the client, **Apollo** solves a lot of problems out of the box, like pagination, subscriptions, optimistic updates, garbage collection etc. No need to write a lot of boilerplate code

Better performance for clients that need to fetch complex data

- Straightforward deprecations and measuring usage of certain fields, API evolution without versioning

- It allows to implement clear domain ownership between multiple teams while still maintaining a general schema. It unifies them and hides their complexity.

Conclusion /

What is good

- On the client, **Apollo** solves a lot of problems out of the box, like pagination, subscriptions, optimistic updates, garbage collection etc. No need to write a lot of boilerplate code
- Better **performance** for clients that need to fetch complex connected data
- Straightforward deprecations and **measuring usage** of certain fields, API evolution without versioning
- It allows to implement clear **domain ownership** between multiple teams while still maintaining a general schema. It unifies them and hides their complexity.

Conclusion /

What is not so good
